WORKING PAPERS

The Oscars of Education: The Effects of a Tournament Between Public Schools (Job Market Paper)

Abstract: This study presents evidence from a rank-order tournament among schools in Brazil. Yearly, top-performing schools receive a non-pecuniary recognition and a financial prize. Further, low-performing schools are designated to a support program, where they are allocated an extra budget and paired with an awardee to implement a cooperation program. A differences-in-discontinuities design is implemented by exploring the timing and eligibility criteria, revealing substantial improvements in students' test scores among eligible schools due to the tournament's introduction. Eligible schools locally outperformed non-competing schools by 0.23 and 0.34 standard deviations in Portuguese and Mathematics, respectively. Furthermore, by exploring an exogenous cutoff that assigns the yearly prize, I implement a fuzzy regression discontinuity design, and I find that winning the award has no effect on test scores three years later. However, performing an analogous procedure, I find that low-performing schools assigned to the support program witness a significant improvement in future test scores.
